

InfTK003 Cross-Industry Software Development Project

As part of the project, the following must be developed:

- Program,
- program documentation.

The project grade is formed from three parts:

- evaluation of the program (40%),
- evaluation of documentation (40%),
 - Software Requirements Specification (SRS),
 - User documentation (user manual).
- defending and answering questions (20%).

Important! The final grade is reduced by one point for each failure to submit a course assignment on time.

The project development procedure:

1. Informative seminar on the progress of the study course and coursework requirements (time and place will be specified).
2. Selection of the topic of the project.
3. Development of Software Requirements Specification (SRS).
4. Program development.
5. Development of user documentation (user manual).
6. Defense of the project (during the session).

Before **October 25**, you must select and write down the topic of the project. The selected topic must be recorded in the file:

https://docs.google.com/spreadsheets/d/1z8cf5wSatiE4fVD5h7QruW_Ssn--wGkpvOIEYDfDrcQ/edit?usp=sharing

After October 25, an in-person session will be organized where topics will be commented on, and it will also be possible to ask questions and clarifications about the project.

As part of the project, it is necessary to develop a Windows program with database and two documents: Software Requirements Specification and User documentation (user instructions, user manual, user guide). The application can be developed as a Windows Forms project or a WPF project. The database management system can be chosen, but it is recommended to use Postgres. The topic can be chosen freely.

The use of a database is a mandatory requirement!

Minimal requirements for the program:

- Number of lines of code for a **WPF** project - at least **300** or The number of lines of code for a **Windows Forms** project - at least **500**.

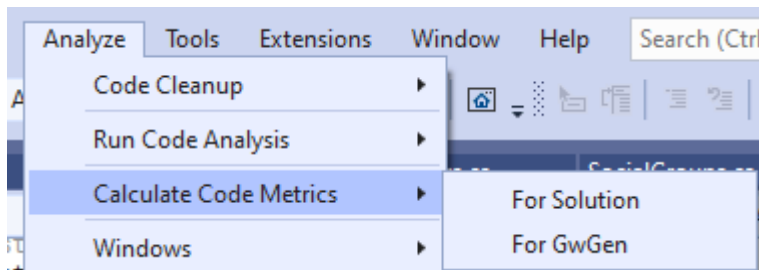

- The number of **tables** in the database is **8**.
-

The defence of the project will take place in person during the session (date will be confirmed later). During the defence, students present their project orally. For defence:

- A presentation must be prepared (for example, in Power Point). The presentation should contain information that includes: requirements for the program (Software Requirements Specification), functionality, result, number of lines of code.
- Program demo
- Answer the questions

Duration of defence 10-15 minutes + questions.

How to count lines of code in Visual Studio:
